

bullfrogs

By William

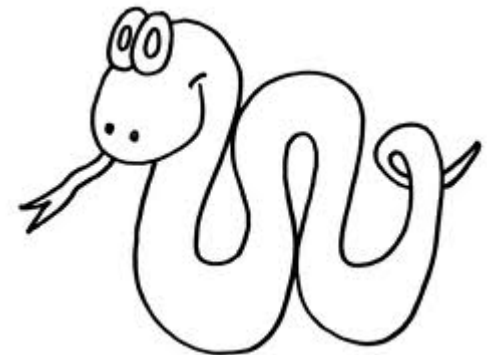

Appearance

Bullfrogs are usually green to greenish-brown. Their eyes are gold or brown and they have a broad flat head and body. They grow on average to be about 3 and a half to 6 inches (9-15 cm) long in body length (although there are records of some as big as 8 inches!!), legs add another 7-10 inches (17 - 25cm) to length!

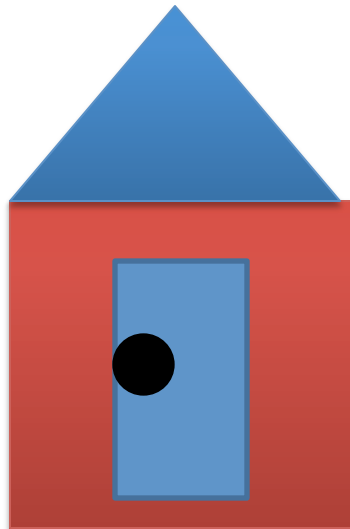

Diet

The Bullfrog eats small mammals, birds, snakes, turtles, field mice, frogs of competing species, even smaller Bullfrogs. Large Bullfrogs will attack and consume smaller Bullfrogs because Bullfrogs are cannibalistic. They eat their own kind.

Habitat

Bullfrogs are able to live in both deep and shallow water. Bullfrogs hide under vegetation, overhanging banks at the water's edge or they sit and rest in shallow water.

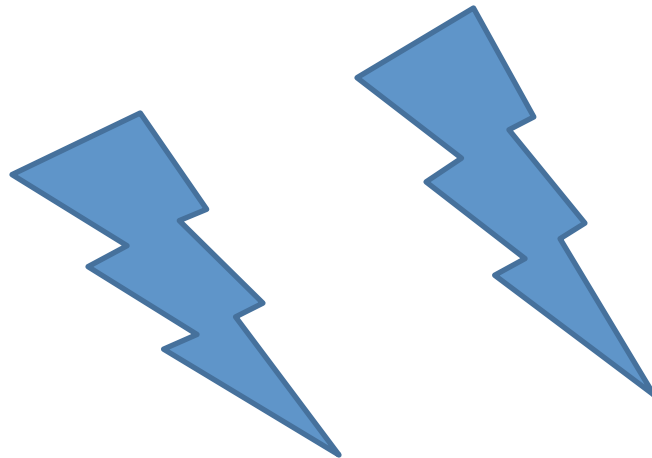

lifecycle

A lifecycle of a bullfrog starts off with an egg then becomes a tadpole, then a frog, then an bullfrog.

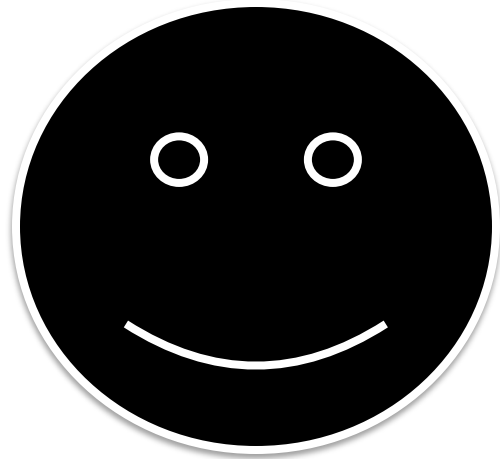

Predators

bullfrogs have several predators, depending on the area they are from. There are coyotes, red tail and other hawks, foxes, even owls have been known to consume bullfrogs.

miscellaneous

The average life span for these guys tends to be around 4 to 5 years, though there are records of bullfrogs living as long as 6 or 7 years.

sounds

Bullfrogs don't actually make much sounds they only make sounds when they are in danger by there predator.

mouth

When they eat their prey their mouth is really big because their prey might be really big.

The end
